KIN COMMENCES NEW EXPLORATION PROGRAM SOUTH OF +8Moz SONS OF GWALIA MINE

Kin Mining NL (ASX: KIN) today announced it will commence an exploration program to test structural targets at its 100%-owned Gwalia South and Paradise North Prospects (Figures 1 & 2).

Both prospects are located immediately south of the +8Moz Sons of Gwalia Mine, owned and operated by St Barbara Ltd (ASX: SBM), 2km south of Leonora, Western Australia.

Kin Mining's CEO, Mr Don Harper, said the initial 3,000m RC drilling program was focused on systematic exploration of the Company's most strategically located prospects.

"By all accounts, the Gwalia Shear Zone is a highly prospective area – but importantly, these targets would be within trucking distance to a proposed processing facility at our flagship Leonora Gold Project," said Mr Harper.

"These structures have been poorly tested in the past, so we see a real opportunity to further explore this prospective gold bearing corridor," he said.

"Given our extensive portfolio of quality prospects, we're able to hand pick opportunities that not only appear to be the most prospective, but also fit with our overall growth strategy of bringing the LGP into production as rapidly as possible," Mr Harper said.

"While our immediate objective is to deliver an updated and enhanced PFS for the LGP, with positive support of our current rights issue, exploration can now become more of a focus for the Company.

"Kin has been developing these highly prospective exploration targets, waiting for the environment in the gold industry to improve and we are optimistic that our time has now come to excel as a gold explorer."

Kin's new exploration program will test Sons of Gwalia and Tower Hill style targets, where historical RC drillhole CWC779 returned a peak intersection of **4m** @ **15.15g/t Au from 170m** down hole near the Annapurna Prospect (Figure 3).

Additionally, Kin's Paradise North Prospect will be drilled where a vertical historical aircore drill hole CWA728 intersected **12m** @ **3.57g/t Au, including 3m** @ **13.3g/t Au from 42m** downhole.

GWALIA SOUTH PROSPECT

RC Drilling is planned to test a series of NW structural faults and lineations that intersect the greenstone belt which hosts the Gwalia Mine sequence (Gwalia slate/chert) and also test the adjoining granite-ultramafic contact that hosts Tower Hill style gold mineralisation.

The main target areas selected for drilling are positioned south and along strike of the Sons of Gwalia gold mine. Historical drilling confirms that the Gwalia Slate and ultramafic greenstone/granite contact have been identified as continuous lithological units that extend into the project area.

The primary target area (Target 1) is the intersection of NW (310°) faults and the northerly trending Gwalia Shear Zone. The proposed drill sections will test the greenstones from the granite contact through to the Mt George/Gwalia Shear Zones (Figure 1).

The drilling strategy is to drill across the strike, where accessible, covering the mafic sequence with a fence of RC drillholes testing the sequence on two drill lines, holes will be orientated east (-60°) and positioned at 100m intervals.

Historic drilling is regarded as ineffective due to a failure to intersect prospective lithological contacts and the shallow depth of the vast majority of holes (see Kin ASX announcement 12 October 2015). The majority of historical drilling is vertical and apart from a few diamond drill holes, no deep drilling has been conducted on the tenements. The target zone covers a geophysical gravity embayment; drilling into the embayment at the Annapurna Prospect by previous mine owners returned a peak intersection of 4m @ 15.15g/t Au from 170m in drill hole CWC779

The second drill objective is to target the Tower Hill style mineralisation along the contact of the Raeside granitoid and the adjoining ultramafic. This sequence marks the contact with the greenstone belt, which hosts the Tower Hill deposit (+1Moz) immediately north of the Sons of Gwalia mine.

PARADISE NORTH PROSPECT

Drilling will also test the Paradise North Prospect (Target 2 - Figure 1) which is located on the adjoining tenement approximately 3km SE of Gwalia South. The same NW (310°) regional structural lineaments targeted at Gwalia South continue through to the Paradise Prospect.

The selected drill zone is characterised by a grouping of ore grade intersections in historic drill holes. The orientation of the shear hosted mineralisation identified to date strikes NE and is subparallel to the Gwalia and Mt George Shear Zones.

The area was previously drilled by Sons of Gwalia Ltd. The peak results from a 1999 aircore drill program returned a best intersection of 12m @ 3.57g/t Au including 3m @ 13.3g/t Au from 42m in CWA728 (Figure 3). The identified mineralisation was never followed up and the next nearest drillhole is 150m away. The mineralisation identified at Paradise North remains open and undefined.

Evaluation of the drill database confirms a mineralisation trend to the west of this hole and numerous historic high-grade drill intersections have identified a zone of supergene gold enrichment. The prospective corridor presents as a high priority walk up drill target.

About Kin Mining NL

Kin Mining (ASX: KIN) is an emerging gold development company with a significant tenement portfolio in the Eastern Goldfields of Western Australia. Through exploration success and selective acquisition, the Company aims to become a profitable, high-margin, low cost Australian gold producer. The immediate focus of the Company is completing an updated pre-feasibility study at its flagship Leonora Gold Project (100%), containing a JORC resource of 722koz, by the end of the calendar year.

Kin's exploration is targeting near-mine and prospects within the transport corridor linking further discovery to a proposed independent processing plant located at the Leonora Gold Project. Kin aims to conduct its regional exploration programmes within its extensive and highly prospective project portfolio with an ongoing focus of limiting dilution.
